	Watch	"Mandatory Odd/Even Restrictions"
	Warning	"Mandatory No More than 2 days per week of outdoor watering"

“NORMAL CONDITION”

Based on current water conditions the Board of Water Commissioners have determined that water levels are “Normal” at this time. Based on the Districts Drought Management Plan both ground water levels and precipitation are normal.

Normal ground water conditions, which we are currently experiencing, means there is no need for any actions from the public. However, over time, ground water levels do change and the District will be monitoring and make adjustments in the water condition status if needed.

Customers are reminded that good water-use habits and water conservation practices should be used at all times no matter the conditions. If for no other reason, it will save you money. Less water used is less water to heat and both result in lowering your water bill and energy costs.

The Districts Drought Management Plan, while still in draft form, can be viewed in our Reports & Publications section for further information. Another useful link to watch ground water levels, which the District also uses, is a monitoring well located in Brewster and operated by the USGS. It can be accessed by [Clicking Here](#).
